# Introduction (1/2)

The Lorenz SZ42, codenamed Tunny, was a teleprinter encryption device used by Germany during WW2 for strategic communications. Its successful cryptanalysis at Bletchley Park provided the Allies with high-grade intelligence about several fronts, as well as for the preparations for the D-Day landings.

The story of Tunny's codebreaking and Colossus is well known, following the declassification of the General Report on Tunny in 2000, and the publication of several books. More details can be found in the references [CR10, Gan14, RDF15, Las20].

## Introduction (2/2)

The work of the Testery, the other Tunny section at Bletchley Park, is less known. Named after its commander, Major Ralph Tester, the Testery was responsible for the development and application of hand methods, that complemented the work of machines like Colossus. For some reason, the report on the Testery was not declassified until 2018.

A detailed functional description of the SZ42 is given in the additional zip file, as well as a simulator, and hints for cryptanalysis.

## Challenge (1/3)

This is the tenth challenge in a series of 13 level-2 challenges with the SZ42.

With this challenge, we provide one ciphertext and one plaintext, both consist of 500 characters.

As described in the additional file “Lorenz\_SZ42.pdf” some SZ42 models use motor limitations which are intended to reduce the number of motor stops, making cryptanalysis more challenging.

There are no motor limitations in this challenge.

## Challenge (2/3)

To solve the challenge, you need to recover the wheel patterns from known-plaintext and ciphertext.

The solution consists of the patterns for the CHI1 and CHI2 wheels.

The starting positions for the CHI wheels are:

3 17 18 17 16

Please enter the solution in the form of two pattern strings separated with a space.

For example if CHI1 is "x.x.x.x." and CHI2 is "xx..xx.." then you would enter: "x.x.x.x. xx..xx..".

## Challenge (3/3)

The attached zip file includes:

1. Additional provided material, e.g. ciphertexts (and plaintexts)
2. A simulator in Java, used to create the challenges
3. A functional description of the SZ42, including the description of the Baudot alphabet and its notations
4. Ideas for possible attacks
5. *key.txt* and *key\_description.txt* containing an example key for the SZ42
